Stage 2

User Story: Admin Management System

As an admin, I want to log in and manage users so that I can view, update, activate, deactivate, and delete users in the system.

1. Admin Login Requirements

No Registration for Admin

- **Admin does not need to go through the registration process.**
- **Admin credentials should be predefined and stored in the MySQL database.**

Direct Login

- **Admin should log in directly using the predefined username and password.**
- **Required login inputs should be accepted using the Scanner class.**

User Role

- **Add a user_role field to differentiate between a regular user and an admin.**
- **The role values can be ROLE_USER and ROLE_ADMIN.**

Admin Exclusion from Failed Login Attempts

- **Admins should not be a part of the user-level failed login attempts functionality.**

2. Admin Dashboard

After the admin successfully logs in, the system should display an Admin Dashboard menu in the console, where the admin can manage users.

3. Admin Actions on Users

3.1 Search Users

Admin should be able to search users by:

- **First Name**
- **Last Name**
- **Email**
- **Mobile Number**

- **Username**
- **Status**

3.2 View User Details

Admin should be able to view detailed information about a selected user, including:

- **Full Name**
- **Email**
- **Mobile**
- **Status (active or inactive)**
- **Loan Applications, if applicable.**

3.3 Change User Status (Activate/Deactivate)

Admin should be able to:

- **Activate a user by setting status to Active.**
- **Deactivate a user by setting status to Inactive.**

3.4 Delete User

Admin should be able to delete a user from the system.

The system should:

- **Prompt for confirmation before deletion.**
- **Log the deletion action for auditing purposes.**

4. Notification System for Users

After each action taken by the admin, the affected user should receive an email notification with details of the operation.

Notifications should be sent for the following actions:

Account Activation

Send an email informing the user that their account has been activated.

Account Deactivation

Notify the user that their account has been deactivated and they will no longer be able to log in.

Account Deletion

Send a final email notifying the user that their account has been deleted.

Edit User Information

Notify the user that their information has been updated by the admin.

Email Content

Subject: Account Update Notification

Activation

Dear [First Name], your account has been successfully activated by the admin. You can now log in to the system.

Deactivation

Dear [First Name], your account has been deactivated. Please contact support for more information.

Deletion

Dear [First Name], your account has been deleted from the system. If this was a mistake, please contact support immediately.

Edits

Dear [First Name], your account details have been updated. If you did not request this change, please contact support immediately.

5. Security and Validation

Role-based Access Control

- **Only users with the ROLE_ADMIN role should be allowed to perform admin-specific actions.**
- **Regular users should not be allowed to perform admin actions.**

Validation for Admin Actions

- **All inputs should be properly validated when the admin edits user details or performs other actions.**

Console-Based Admin Menu

After successful admin login, the system should provide options for managing users:

- **Search Users**
- **View User Details**
- **Edit User Information**
- **Activate User**

- **Deactivate User**
- **Delete User**
- **Logout**

All required inputs should be accepted using the Scanner class.

All database operations should be performed using JDBC.
